**Topic Expert Group:** Patient safety and hygiene practice

**Central venous catheter infection prevention**

Helder O, Tissières P, Mader S, Thiele N, Borghesi A

**Target group**
Critically ill infants and parents

**User group**
Healthcare professionals, neonatal units, hospitals, and health services

**Statement of standard**
Each hospital has central venous catheters insertion and maintenance bundles, that are consistently applied to reduce the incidence of central line-associated bloodstream infections.

**Rationale**
Central venous catheters (CVC) are intravascular devices used in NICU settings. In addition to ensuring long-term intravenous access to preterm and critically ill infants, CVC are used for the administration of parenteral nutrition and medications that cannot be safely administered through a peripheral intravenous catheter. (1) CVC are important components of care, but their use is associated with an increased risk of central line-associated bloodstream infections (CLABSI). (2) CLABSI are in turn responsible for considerable mortality, morbidity, prolonged hospital stay, and additional costs for healthcare systems. (3)

Definitions of neonatal bloodstream infection vary across studies. (4–6) Bloodstream infection according to the Centers for Disease Control and Prevention (CDC), can be considered to be CVC-related if a catheter has been in place for at least 24 hours or if it was removed less than 48 hours before the infection. (7)

The prevalence of CLABSI is usually expressed as CLABSI per 1000 central line-days. (8) Reported incidence in neonatal units varies depending on several factors, including the hospital site and the gestational age group, and may be as high as >10.0 per 1000 central line-days. (9,10)

The Institute for Health Improvement (IHI) and the CDC, developed ‘care bundles’ that aim to reduce the incidence of CLABSI. Care bundles (defined as small, straightforward set of evidence-based practices, according to the IHI) can be divided into two subgroups: insertion bundles and maintenance bundles. (11,12)

Basic elements for the care bundles are maximal sterile barrier precautions during insertion, skin antisepsis, and hand hygiene. Care bundles have proven effective in reducing the incidence of CLABSI in neonatal units. (8)

**Benefits**

**Short-term benefits**
- Reduced risk of CLABSI (1–3,8–10,13)
- Reduced risk of comorbidity associated with bloodstream infections (consensus)
- Reduced mortality (consensus)
- Reduced stress for parents (consensus)

**Long-term benefits**
- Reduced risk of antibiotic resistant bacteria (consensus)
- Reduced risk of poor neurodevelopmental outcome (consensus)
- Reduced healthcare costs (8)
- Reduced length of hospital stay (8)

**Components of the standard**

</table>
7. Insertion of a CVC: checklist is used before starting the intervention. (16)

For neonatal unit
8. A unit guideline on CVC insertion and maintenance bundles is available and regularly updated.

9. The prevalence of bloodstream infections per 1000 central line-days is documented.

10. Training on CVC insertion and maintenance bundle elements is ensured. (15)

For hospital
N/A
For health service
11. A national guideline on CVC insertion and maintenance bundles is available and regularly updated.

12. Central line-associated bloodstream infections rates are publicly available.

Where to go – further development of care

Further development

For parents and family
- Facilitate parents to use publicly available central line-associated bloodstream infections (CLABSI) rates to question variation between hospitals.

For healthcare professionals
N/A

For neonatal unit
- Ensure an incidence <5 CLABSI per 1000 central line days. (17)
- Report all deviations from guideline practice as clinical incidents using the hospital reporting system (critical incidence reporting system).

Grading of evidence

A (High quality)
B (Moderate quality)
For hospital

- Prepare fluids and medication under optimal aseptic conditions.  B (High quality)

For health service

- NICU benchmarking: report the prevalence of CLABSI per 1000 central line days.  B (Moderate quality)
- Provide benchmarking standards: excellent performance < 3.5 CLABSI per 1000 central line days, moderate performance 3.6 to 5 CLABSI per 1000 central line days, and poor performance ≥ 5.1 CLABSI per 1000 central line days.  B (Moderate quality)

Getting started

Initial steps

For parents and family

- Parents and family are verbally informed by healthcare professionals about hand hygiene.

For healthcare professionals

- Attend training on insertion bundles.
- Attend training on maintenance bundles (for nurses).

For neonatal unit

- Develop and implement a unit guideline on central venous catheter (CVC) insertion and maintenance bundles.
- Develop information material on hand hygiene for parents.
- Document all bloodstream infections among admitted infants.
- Document the number of central line days.
- Provide appropriate equipment.

For hospital

- Support healthcare professionals to participate in training on CVC insertion and maintenance bundle elements.

For health service

- Develop and implement a national guideline on CVC insertion and maintenance bundles.
- Publish the incidence of central line-associated bloodstream infections per 1000 catheter days.
