**Topic Expert Group:** Infant- and family-centred developmental care

**Family access**

**Target group**

Infants, parents, and families

**User group**

Healthcare professionals, neonatal units, hospitals, and health services

**Statement of standard**

Parents (and substitutes designated by the parents) have continuous access and are able to remain with the infant throughout the 24 hours.

**Rationale**

Throughout Europe there is evidence that parents do not have 24-hour access to their infant. (1–3) Early separation is harmful for both newborn infants and their parents, since it disrupts the biological and emotional bonding that has developed already during gestation. (4,5) Separation between parents and infants has short- and long-term consequences. This acts as a stressor with effects on the physical and mental health for both the infant and family, it may interfere with breastfeeding, and alter the bonding and attachment process. Researchers have suggested that parent engagement in the NICU has the potential to be a low cost, high quality intervention with a positive influence on the health outcomes of preterm or ill infants and their parents. (6)

Thus, there is a clear rationale to have the neonatal units open throughout the 24 hours for parents (or by them designated substitutes) and to provide facilities for parents and family members to stay with the infant without interruption in, or adjacent to the neonatal unit.

**Benefits**

**Short-term benefits**

- Improved parent-infant bonding (7)
- Increased breastfeeding rates (8)
- Longer skin-to-skin contact (9)
- Reduced short-term pulmonary morbidity (10)
- Improved feeding (11) and weight gain (12)
- Reduced stress for infants (13)
- Increased neuro-behavioural stability in preterm infants (14)
- Increased parental involvement (14,15)
- Reduced length of stay in the NICU (10,14,16)
**Long-term benefits**

- Improved parent-infant interaction following discharge (17)
- Reduced rates of readmission following NICU discharge (18)
- Reduced costs of NICU hospitalisation (17)
- Improved parental mental health (11,16,19–22)

Getting started

Initial steps

For parents and family
• Parents and family are verbally informed by healthcare professionals about the importance of being present and being the primary care giver during neonatal care.
• Parents are encouraged to spend as much daily time as possible with direct physical access to their infant over several feeding and caring times.

For healthcare professionals
• Promote meetings with all caregivers to discuss attitudes, barriers and concrete solutions to establish access throughout the 24 hours in the NICU for parents.

For neonatal unit and hospital
• Develop and implement a unit guideline on opening of the NICU throughout the 24 hours for parents (or designated substitutes).

For health service
• Develop and implement a national guideline on 24-hour unit access for parents (or family designated substitutes) and infant- and family-centred developmental care.

Description

Early separation can affect maternal post-natal bonding (24), which in turn has been suggested to be a risk factor for the socio-emotional infant development. (25) Effects of early exposure to NICU stress may be at least partially alleviated by
developmental care practices. Parental presence, including the fostering of an early closeness between mother and newborn infant, has been shown to have short-term benefits for the infants. (10,15)

There are few studies that examine whether the actual amount of parental daily access is directly related to the effects seen for parental participation in care. Reynolds and colleagues examined parental access and parental holding of their infants in the NICU. Increased access was associated with generally better parameters of infant neurobehavioral functioning on the NICU Network Neurobehavioral Scale (NNNS) (26), while more holding was associated with improved quality of movement, less stress, less non-optimal arousal and less excitability of infants on the NNNS assessment. O’Brien and co-workers report higher rates of breastfeeding when the parents spend ≥8 hours per day in the NICU and participate in a Family Integrated Care model. (8)

When there is 24-hour access, parents have more opportunities to participate in various aspects of touching, holding, and caring for their infant and this participation in care will typically lead to beneficial effects for both the infant and family. However, 24-hour access does not necessarily assure that parents are participating actively in care of their infant. (2) Suggestions for supporting active, effective parental involvement in the care of their infant in the NICU will be addressed elsewhere.

Surveys of degree of parental participation in care and intervention studies which aim to study, and influence parental participation in care indicate a number of specific benefits (see benefits section). (6)

Infection risk management
In times of increased infections in the community, access for parents and extended family members is limited. A review of the literature related to epidemic nosocomial infection in neonatology proposes some preventing measures: (27)

- To limit the access of family members with on-going infection or who have been exposed to an infection recently
- To limit the duration and number of visits per week for siblings during the epidemic periods
- To vaccinate hospitalised infants and their relatives
- To wear protective masks, in the case of respiratory infection
- To reinforce hand hygiene measures

Ethical arguments
Beyond the increasing scientific evidence for the importance of parental presence with their infant in the NICU, there is an important human and spiritual consideration about the importance of early parent-infant contact for healthy human growth. And conversely, reduction of distress arising from separation of infant and parent is a moral imperative that goes beyond providing appropriate medical and nursing care for the infant. These considerations are addressed in the Humane Neonatal Care Initiative. (28)

Legal context

- Article 7: The child … shall have the right from birth to … be cared for by his or her parents
• Article 9: States Parties shall ensure that *a child shall not be separated from his or her parents* against their will …

In essence this is the right of the child to be with his or her parents at all times, including during periods of hospitalisation.

In the area of neonatal care, this means that not only providing adequate care to infants should be legally recognised in each country; but that healthcare institutions must provide ways for infants to be with their parents (family members) as a universally sanctioned legal right. The infant has a legal right, which should be provided for, by whatever means necessary, to be with their parent.

The European Association for Children in Hospital defines 10 Rights of Hospitalised Children in its Charter, Leiden, 1998 indicates:

• Point 2: a hospitalised child has the right to have both parents or their substitutes present day and night whatever his age or his medical condition.

• Point 3: we shall encourage the parents to remain with their infants and facilities should be offered to them with no extra cost to them or no loss in salary. Parents shall be informed about the rules and the operating conditions of the unit in order to let them actively participate in the care of their infants.

In some European countries national laws are available on the topic, for example:

**France**
- DH/E03/688 du 23/11/1998 specifies that whatever the situation, the mother, father or who cares for the infant must have access to the paediatric infant so long as the infant wishes them to stay
- HAS “Prise en charge de l’enfant et de l’adolescent 2011”- everything should be organised to allow parental access for hospitalised infants

**Norway**
- Forskrift om barns opphold i helseinstitusjon, Lov data Dato FOR-2000-12-01-1217

**Portugal**
- Lei n 106/2009 Hospitalisation Family Support- Portuguese Law

**Spain**
