**Topic Expert Group:** Patient safety and hygiene practice

**Monitoring errors**

De Luca D, Tissiéres P, Helder O, Thiele, N, Perapoch J

**Target group**
Infants and parents

**User group**
Healthcare professionals, neonatal units, hospitals, health services, and technical staff

**Statement of standard**
Physiological monitoring is provided to any infant admitted to a NICU, which is tailored to the individual clinical situation.

**Rationale**
Neonatal intensive care allows the monitoring of several physiological parameters, with a range of technologies available. New techniques will expand the number of physiological parameters measurable in NICUs and will provide monitoring previously available for older patients. (1)

The increased range of monitoring parameters available produces challenges in their measurement and interpretation, due to the novelty and complexity of the monitoring technology, to a lack of understanding of some relatively new monitoring parameters or to technical errors in the monitoring itself or human error. (2,3) Neonatal quality-assurance procedures and protocols should be directed to improving the accuracy and quality of monitoring. (4) Although monitoring errors are generally less frequent and severe than drug administration errors (2), improved evaluation of monitoring results will allow better clinical decisions.

Standard monitoring technologies are used in NICUs (ECG, saturation, plethysmography), but advanced monitoring may be necessary and include double saturation and perfusion index, (5) near-infrared spectroscopy (NIRS) (6,7), electrical cardiometry (8,9), amplitude-integrated-EEG (10,11), heart rate variability (12), complex respiratory function monitoring (including electrical impedance tomography, respiratory inductance plethysmography and semi-quantitative lung ultrasound) (13–15), and metabolic monitoring. (16,17) All these technologies provide potential benefits for neonatal care and individual use is recommended only after healthcare professionals’ education and training (see TEG Education & Training).

**Benefits**

**Short-term benefits**
- Improved understanding of the disease process (18)
- Targeted clinical decisions to the individual condition (18)

**Long-term benefits**
- Reduced mortality (19)
- Reduced risk of major morbidities (19)
Components of the standard

Getting started

Initial steps
For parents and family
• Parents are verbally informed by healthcare professionals about monitoring technologies used.

For healthcare professionals
• Attend training on the use of monitoring equipment, application and interpretation as well as different monitoring technologies and their physiological/clinical value.
• Attend training on technical details about the way to start monitoring, positioning electrodes, and calibration.

For neonatal unit
• Develop and implement a unit guideline on the use of monitoring equipment, application and interpretation as well as management of monitoring errors.
• Develop information material on monitoring for parents.
• Develop a protocol and flow chart for serial calibration and maintenance of monitoring devices.
• Develop an internal monitoring protocol, including reference values for evaluation and technical details for each device.

For hospital
• Support healthcare professionals to participate in training on the use of monitoring equipment, application and interpretation as well as different monitoring technologies and their physiological/clinical value.
• Support healthcare professionals to participate in training on technical details about the way to start monitoring, positioning electrodes, and calibration.
