**Overview**

Pregnancy and childbirth represent a critical time period requiring proper counselling about potential pregnancy complications. Women – especially those at risk – can be supported by a broad range of interventions that aim at reducing the risk of preterm birth and improving the health of mother and infant.

One aspect is that the regional organisation of perinatal care needs to be based on designated centres of care, categorised as specialist or non-specialist centres, specifying activity that is appropriate in each (1–5). In order to manage women at risk, to prevent preterm birth, and to ensure appropriate care for preterm infants, differentiation between low-risk and high-risk pregnancies is important. One essential component of obstetric care is the education of pregnant women about signs and symptoms of preterm birth (6–9), as it fosters the early identification of women at risk for pregnancy complications and preterm birth.

In critical situations during the ante-, intra- and post-partum period, maternal and/or neonatal transfer may be required, as provision of specialist care may reduce the incidence of preterm birth and the associated fetal/neonatal and maternal complications. (5,10,11) As newborn infants born to women transferred antenatally have better outcomes than those transferred postnatally, the primary goal of perinatal centralisation is that women and newborn infants receive obstetric and neonatal care in appropriate facilities. (5,10,11) It is important to recognise that neonatal transports, when necessary, are a critical phase with specific needs for a specialised team and equipment to ensure maximal safety and efficiency. (12) Both maternal and neonatal transfer should be carried out in a timely, safe, and efficient manner, following the aim to avoid separation of mother and baby.

The Topic Expert Group on Birth and transfer develops standards on organisational aspects of perinatal care, including antenatal transport of the mother with her baby in the womb and adequate intra- and inter-hospital transport of the newborn baby. Furthermore, the standards focus on information provision and counselling about potential risk factors for preterm birth.

**Sources:**

Collaboration with parents in ante- and perinatal care

Target group
Pregnant women, their partners, and families

User group
Healthcare professionals, neonatal units, hospitals, and health services

Statement of standard
Pregnant women and their partners receive complete and accurate personalised information and support during pregnancy and childbirth to achieve efficient, optimal and respectful collaboration.

Rationale
In order to achieve efficient and effective collaboration, parents must receive accurate and understandable information during pregnancy and birth. Better collaboration with parents will be achieved by timely and interdisciplinary counselling in a language they can easily understand. (1–5)

This should comprise of a comprehensive counselling/advice on pre-conceptional and maternal issues, sexual and reproductive health, healthy lifestyle, healthy pregnancy, and place and mode of delivery. (1,3–20)

Pregnancy and childbirth represent a critical time period when a woman can be supported through a variety of interventions aimed at reducing the risk of preterm birth and improving her health and that of her unborn infant. (8,10–23) This includes basic antenatal care, identification of women at risk for pregnancy complications and preterm birth, allowing preventive measures and therapeutic interventions to be implemented in cases of threatened preterm delivery (i.e. tocolytics, antibiotics, antenatal corticosteroids for lung maturation, and magnesium sulphate for neuroprotection). (1–28)

Benefits
- Better informed pregnant women and their partners (3–10,12,13,16–20)
- Reduced risk and early recognition of pregnancy complications allowing earlier prophylactic and therapeutic treatments (1,11–15,23–28)
- Better informed parents in situations necessitating consensual decisions such as preterm labour or preterm delivery and/or postnatal care (1–20)
- Improved parental confidence when interacting with healthcare professionals (2–20)
- Reduced stress and anxiety for parents (2–20)

Information provision for women about the risk for preterm birth (PTB)

Target group
Pregnant women and their partners

User group
Healthcare professionals caring for women, perinatal units, hospitals, and health services

Statement of standard
All (pregnant) women receive timely information and counselling about potential risk factors for and signs and symptoms of preterm birth and how to find appropriate healthcare advice. (see TEG Follow-up & continuing care)

Rationale
Risk identification and education regarding the signs and symptoms of preterm birth are essential components of obstetric care. They should be a routine part of obstetric care, since counselling of women and their partners and early intervention may be effective in reducing the risk of preterm birth. Healthcare providers (be it a midwife, general practitioner or an obstetrician/gynaecologist) should be able to advise and appropriately triage patients at risk for preterm birth. (1–10)

Differentiation between low risk and high risk pregnancies is important to assess the best strategy of preventing preterm birth or managing women at risk. Specific standards of care should be applied to women with known risk factors for preterm birth. Early detection and provision of specialist care may reduce the incidence of preterm birth and the associated fetal/neonatal and maternal complications. (1–10) Although for the majority of preterm births the cause may be uncertain, there are specific risk constellations that women and healthcare professionals should be aware of.

Criteria/risk factors for preterm birth include pregnancy related factors, demographic and behavioural factors, underlying medical conditions of the mother and fetal conditions (detailed information see table at “description”). (1–10)

Benefits (4,7,11–22)

Short-term benefits
- Better informed women and partners (6,11–14,17,20–24)
- Improved pregnancy follow-up (4,11,15,17,20,21)
- Earlier recognition of impending complications (4,11,15,19–21)
- Earlier transfer/referral to a specialist (4,11,15,17,19–21)
- Better and earlier initiation of prophylactic or therapeutic regimens (4,11,15,17–21)
- Reduced perinatal mortality and morbidity (12,15–21,24)
- Reduced maternal mortality and morbidity (12,17–19,23,24)
- Reduced healthcare costs (12,17)
Long-term benefits
- Improved short- and long-term outcomes (mother and infant/child) (consensus)
- Reduced healthcare costs (consensus)
- Increased population awareness about pregnancy complications (consensus)

Getting started

Initial steps

For parents and family
- Parents are verbally informed in a timely manner on healthy pregnancy and pregnancy complications by healthcare professionals.

For healthcare professionals
- Attend training on the risks and signs of preterm birth and tools for assessment of risk for impending preterm birth and pregnancy complications.
- Counsel women/couples (e.g. by midwives, general practitioners, obstetricians/gynaecologists).

For perinatal unit
- Develop and implement a unit guideline on procedures and algorithms for the management of threatened preterm birth and underlying conditions.
- Distribute information material on healthy pregnancy and pregnancy complications for parents.

For hospital
- Support healthcare professionals to participate in training on the risks and signs of preterm birth and tools for assessment of risk for impending preterm birth.

For health service
- Develop and implement a national guideline on procedures and algorithms for the management of threatened preterm birth and underlying conditions.
- Develop information material on healthy pregnancy and pregnancy complications for parents.

Description

Risk factors for preterm birth (3–10)

Pregnancy related conditions
- Reproductive history: history of (spontaneous) preterm birth or abortion
- Preterm labour: may be caused by several conditions: multiples, hydramnios, infection, ...
- Multiple pregnancy
- Pregnancy complications: Gestational diabetes, hypertensive disorders (preeclampsia), intrauterine growth restriction, vaginal bleeding in early pregnancy, cervical insufficiency
- Assisted reproduction techniques: higher number of multiples and increased risk of pregnancy complications
- Uterine/cervical infections

Fetal conditions
- Fetal malformations
- Intrauterine growth restriction
Underlying medical conditions
- Uterine or cervical abnormalities
- Chronical medical disorders: hypertension, renal insufficiency, diabetes mellitus, autoimmune diseases, anemia

Demographic factors
- Age: particularly young (<17 years) or older women (>35 years)
- Ethnicity: higher risk for preterm birth in black women
- Socioeconomic background: low education level, low income, little social support does play a role for preterm birth
- Genetic influence: Specific fetal and maternal genotypes

Modifiable lifestyle risk factors
- Short inter-pregnancy interval
- Smoking or substance abuse
- Exposure to environmental pollutants
- Under- and overweight (obesity)
- Unbalanced diet
- High stress level
- Suboptimal prenatal care

Maternal transfer for specialist care

Target group
Pregnant women and their partners

User group
Healthcare professionals, perinatal units, hospitals, and health services

Statement of standard
Transfer of pregnant women for specialist care (for mother and/or newborn infant) is an essential component of perinatal care and is carried out in a timely, safe and efficient manner.

Rationale
As newborn infants born to women transferred antenatally have better outcome than those transferred postnatally, the primary goal of perinatal centralisation is that women and newborn infants receive obstetric and neonatal care in appropriate facilities. Maternal transfer refers to the transfer of a pregnant woman during the ante-, intra- and occasionally also postpartum period for special care of the woman, the newborn infant, or both. (1–15)

Antepartum transfer avoids separation of mother and the newborn infant in the immediate postpartum period, allows mothers to communicate directly with neonatal intensive care unit (NICU) healthcare providers, and supports the goal of family-centred care. (16) Establishing uniform indications and contraindications for maternal transfer and formal transfer agreements (emphasising needs and requirements and capacity of local resources and facilities) will help to ensure safe transfer. (12,15)

The main factor to consider when deciding the need for maternal transfer is that expected benefits outweigh potential risks of maternal transfer. (12,15) The condition to be ultimately avoided is a birth occurring during maternal transfer. In case this is foreseen, and the centre does not have the appropriate level of care for that birth, neonatal transfer has to be organised immediately, according to the clinical, structural and geographical situation already before birth. (1,2,12–15,17,18)

Benefits
- Improved medical care for pregnant women and their infants (2,19,20)
- Improved neonatal, maternal and family outcome (2–8,10,11,15,19,20)
- Improved long-term maternal and child health (consensus)
- Improved education/training for healthcare professionals (1,21,22)
- Improved organisation of perinatal care (1,2,18,20,21,23,24)
- Reduced healthcare costs (4)

</tbody>
</table>
**Getting started**

**Initial steps**

*For parents and family*
- Parents are verbally informed by healthcare professionals about indications for maternal transfer to the appropriate level of care.

*For healthcare professionals*
- Attend education and training about indications, contraindications, and necessities for maternal transfer.
- Be aware of and follow protocols for maternal transfer.
- Attend specialty training through on-the-job training or through professional education programmes.

*For perinatal unit*
- Develop and implement a guideline on maternal transfer.
- Develop information material on maternal transfer for parents.
- Establish perinatal networks.

*For hospital*
- Support healthcare professionals to participate in training on the indications and contraindications for maternal transfer as well as neonatal life support.
- Provide perinatal units with appropriately trained healthcare professionals and equipment for transfer.
- Identify and provide resources for establishing and maintaining or cooperating with ambulance services.

*For health service*
- Develop and implement a national guideline on maternal transfer.
- Provide regional/national eHealth databases for perinatal units.

**Description**

When preterm or medical complications are anticipated, early consultation with and transfer to the appropriate centre as necessary is mandatory.

*The most common obstetric indications for maternal transfer* (12,14,15)
- Preterm labour
- Preterm rupture of membranes
- Severe hypertensive disorders (preeclampsia/HELLP syndrome)
- Antepartum haemorrhage (controlled haemorrhage and stable maternal condition)
- Medical disorders complicating pregnancy (such as diabetes, renal disease…)
- Multiple gestation
- Intrauterine growth restriction
- Fetal abnormalities
- Maternal trauma

*Usually for gestational ages below 32 or 34 weeks, depending on the health service structure*
Under some circumstances, maternal transfer is not possible, such as: (12,14,15)
- Unstable condition of the pregnant woman
- Uncontrolled haemorrhage
- Unstable fetal condition, threatening to deteriorate rapidly
- Imminent delivery
- No experienced attendants available to accompany the woman
- Too risky weather conditions

Consent for transfer
Appropriate time should be dedicated to explaining to the mother and the family the reasons for transfer and provide adequate directions for the family to the new centre.

Equipment for maternal transfer (14,15)
- Vehicles are equipped as for every high risk/emergency patient with an additional “Emergency Birth Kit” (a sealed kit should be available in every vehicle used for transfer of a pregnant woman):
  - Tocolytic drugs
  - Magnesium sulphate (for eclampsia prophylaxis)
  - Antihypertensive drugs
  - In case of unexpected birth: Cord clamps, scissors, warm blanket for the newborn infant (space blanket), uterotonic drugs, container for placenta, retaining system (to secure the newborn infant with the mother during skin to skin during journey)
  - If the delivery occurs in the ambulance, in most cases only initial steps of resuscitation may be needed (for about 99% of the newborn infants step A and B of ILCOR will be sufficient) – figure; someone skilled in neonatal life support should travel with the mother if she is in active labour. (32) (see TEG Medical care & clinical practice)
  - Equipment: neonatal bag/mask (sizes 0 to 2) system, neonatal laryngoscope, battery-powered suction device, suction catheter (size 8, 10 and 12 CH), Guedel airways (size 4, 5 & 6), SpO$_2$ probe, orogastric feeding tube

Appropriate transfer protocols should be available, in particular for emergency events occurring during transfer such as eclamptic fits, placental abruption, cord prolapse, delivery during transfer, neonatal resuscitation, post-partum haemorrhage, sepsis, maternal cardiac arrest

Drugs with the best safety profile should be utilised during transfer, i.e. tocolytics with less maternal side effects. MEOWS (maternal early warning signs) charts should be filled in during transfer. (33,34)

Neonatal transport

Target group
Infants and parents

User group
Healthcare professionals, neonatal units, hospitals, health services, and regional neonatal transport services

Statement of standard
Infants are transferred by a dedicated, specialised medical service that offers a quality of care similar to that promoted in a NICU.

Rationale
The regional organisation of perinatal care based on primary, secondary and tertiary care (see TEG Birth & transfer) mandates the provision of infant transport services to facilitate the flow of patients through the system when antenatal transfer is impossible. (1) Neonatal transport is a critical phase of perinatal care, with specific needs for a specialised team and equipment to ensure maximal safety and efficiency. (2–5) Consensus guidelines and recommendations are proposed by healthcare professionals on paediatric and neonatal inter-facility transport. (1) Efficiency of specialised paediatric and neonatal transport has been evaluated in several studies. (6–15) When an infant no longer needs higher levels of care, a transfer to a hospital closer to the family’s home is recommended. This also optimises the use of available cots for all levels of care and allows the local hospital staff to familiarise themselves with the patient who will be followed up locally.

A standard detailing facilities and capabilities of transport services in the special environment of an ambulance, helicopter or fixed wing aircraft is thus needed throughout Europe.

Inter-hospital communication and regulation of transfers are complex and time consuming tasks that need to be managed by a dedicated call handling/regulation centre at the regional level, covering a sufficiently large area to reach a critical volume of activity.

Intra-hospital neonatal transfer, in particular in situations where the delivery room and the NICU are not adjacent, is also critical and warrants the same standard.

Benefits

Short-term benefits
- Improved medical care and outcomes for infants needing transfer (6–15)
- Improved transfer conditions (consensus)
- Optimised use of NICU and perinatal centres resources (consensus)
**Long-term benefits**
- Improved outcomes for infants and families (consensus)
- Improved overall performance of regional organisation of perinatal care and reduction of healthcare costs (consensus)

Where to go – further development of care

**Further development**

**Grading of evidence**

For parents and family
- Parents are involved in the monitoring of quality of organisation of perinatal care and neonatal transport. B (Low quality)

For healthcare professionals
- Ensure that neonatal transport healthcare professionals are trained, using real conditions and medical simulation. (17,18) A (Low quality)

For neonatal unit
- Ensure the availability of a trained and experienced dedicated team for intra-hospital neonatal transport and for participation in regional transport. B (High quality)

For hospital
N/A
For health service and regional neonatal transport service
- Provide stringent quality improvement programmes including parental satisfaction.

Getting started

Initial steps
For parents and family
- Parents are verbally informed by healthcare professionals about the transport of their infant.

For healthcare professionals
- Attend continuous training on neonatal transfer.

For neonatal unit
- Develop and implement a unit guideline on neonatal transport.
- Develop information material on neonatal transport for parents.
- Equip and staff each neonatal unit for intra-hospital transport and eventual participation to inter-facility transport.

For tertiary level hospital
- Support healthcare professionals to participate in training on neonatal transport.
- Coordinate specialised inter-hospital transport service.

For health service and regional neonatal transport service
- Develop and implement a national guideline and/or a policy statement on neonatal transport.
- Support the development of information material on neonatal transport for parents.
- Provide and structure regional perinatal transport services, including quality control.

Description

Staff and equipment for neonatal transfers
Staff and equipment should be dedicated to undertaking neonatal transport.

Vehicle for road transfer
- A dedicated vehicle should be reserved for neonatal transport
- Vehicles to be used for neonatal transport should conform to European Standard EN 1789 (16)
- In addition, vehicles should have
  - Seating for at least three staff/family
  - No-lifting loading & unloading of incubator equipment
  - Supplies of compressed medical gases sufficient for double the longest anticipated transfer.
  - Secure power supply such that medical equipment may be powered from the vehicle without using incubator batteries.
  - Fridge for drugs conservation
Air transport (helicopter or fixed wing)
- Neonatal transport service must have a structured access to air transport service and facilities.

Equipment
- The neonatal equipment used should conform to European Standards EN 13976-1 and EN 13976-2. (18)
- Equipment used for neonatal transport in air ambulances should additionally conform to EN 13718 - Medical vehicles and their equipment. Air ambulances. Requirements for medical devices used in air ambulances. (17)
- Equipment should be configured such that transported infants
  - Are kept in the thermoneutral temperature zone.
  - Receive the necessary respiratory support.
  - Receive the necessary fluid and drug infusions.
  - Have their vital signs monitored appropriately.
  - Who become critically unstable in transit can receive emergency care (airway, breathing, circulation).

Staff for transfer
- For ground transfers the drivers of vehicles should hold relevant training for driving emergency vehicles.
- The clinical team should include nurse, advanced clinical practitioner, doctor or paramedic depending on the clinical needs of the patient. Healthy infant transfers may be conducted by a nurse alone.
- The clinical team should have received neonatal transport-specific training and be supported by continuing education for transport.
- The work of the clinical team should be supported by transport-specific clinical guidelines.
- Where air transport is anticipated all the staff involved should have received air transport training and preparation and this should be refreshed annually.

Organisation of perinatal care

Target group
Infants, parents, and families

User group
Healthcare professionals, perinatal units, hospitals, and health services

Statement of standard
Perinatal care is organised in specialist and non-specialist centres to ensure access to optimal, preferably evidence-based, care with respect to medical knowledge, organisation structure, and staff.

Rationale
In order to deliver the appropriate level of maternal and perinatal care tailored to the severity of risk, the regional organisation of care needs to be based on designated centres of care, categorised as specialist or non-specialist centres, specifying activity that is appropriate in each. (1–10) Establishing clear, uniform criteria for designation of maternal and perinatal centres that are integrated with emergency response systems will help ensure that the appropriate numbers of trained personnel, physical space, equipment and technology are available to achieve optimal outcomes. It will also facilitate subsequent data collection regarding risk-appropriate care and has been shown to be efficient and effective in producing the best outcome for mothers and infants. (1–35)

Benefits
- Improved medical care for all pregnant women and their partners, but especially for women at risk for pregnancy complications (1,10,15,23–25,27,28,34–36)
- Improved (physical and psychological) maternal outcome (1,10,15,22,24,25,27–29,34,36)
- Improved neonatal care and outcome (1,8,10,11,13,14,16,18,19,21,23,26,30–33,36)
- Improved education/training for healthcare professionals (1,27,28,36,37)
- Increased specialist expertise (1,24,25,27,28,36,37)

**Getting started**

**Initial steps**

**For parents and family**

• Parents are verbally informed by healthcare professionals about perinatal care.
For healthcare professionals
- Attend training on perinatal care.
- Enhance specialty training through on-the-job training and professional education programmes.

For perinatal unit
- Develop and implement a unit guideline for standard and emergency care as well as transfer.
- Distribute information material for parents on perinatal care.
- Develop clinical perinatal networks.

For hospital
- Support healthcare professionals to participate in training on perinatal care.
- Collect information on perinatal care standards and equip perinatal units with appropriate healthcare professionals and material for patient care and training.
- Provide resources for establishing and maintaining a perinatal unit.
- Provide opportunities for on-the-job training, and experiential learning environments (clinical placements) for students undertaking professional education programmes.
- Develop clinical perinatal networks.

For health service
- Develop and implement a national guideline for standard and emergency care as well as transfer.
- Develop information material for parents on perinatal care.
- Submit and review perinatal data and output of surveillance systems.
- Monitor perinatal outcomes using European obstetric surveillance system (such as Europeristat).
